

ASTROPANDIT CONNECT

Interactive Web App Flow & Architecture Guide

A comprehensive operational blueprint and technical reference detailing the user journeys, astrologer console dynamics, administrative management consoles, real-time consultation rooms, and transactional structures.

SYSTEM ARCHITECTURE BOOKLET

Prepared for: Company Owner / Project Lead

Author: AstroPandit Technical Development Partner

Date of Publication: June 2026

Target Platform: Next.js (Client/Server) & Firebase Cloud Suite

Table of Contents

1	Executive Platform Summary	2
2	Seeker (User) Journey & Astrology Services	3
3	Astrologer Onboarding & Expert Workspace	4
4	Admin Monitoring Console & Approvals Portal	5
5	Live Consultation Room & Chat Mechanics	6
6	Technical Architecture & Database Collections Schema	7
7	Security Protocols & Leak Mitigations	8

1. Executive Platform Summary

AstroPandit Connect is a modern, real-time consultation and astrology platform engineered to bridge Seekers (users searching for astrological guidance) with verified Astrologers (Vedic experts). Built using Next.js 15, TailwindCSS, and Firebase, the platform delivers zero-latency consultation chatrooms, dynamic Kundli matchmaking calculators, localized daily Panchang indices, and secure wallet recharge workflows.

The core design philosophy targets premium glassmorphism aesthetics, accessibility across mobile/desktop, robust security rules preventing unauthorized data leakages, and dynamic fallback pipelines for cloud asset management.

2. Seeker (User) Journey & Astrology Services

The Seeker represents the core consumer role. Their experience begins with authentication and expands into personalized astrology calculations and direct live astrologer consultations.

1

Authentication & Onboarding

Users register via `/login`. New users are directed to `/onboarding` to save their birth details (Date, Time, Location). This data is cached in client context to pre-fill future requests.

2

Daily Horoscope & Localized Panchang

Visiting `/horoscope` queries coordinates dynamically. Using the client's IP address (fallback for local development) or Vercel Geo-IP headers, the system queries local coordinates to compute exact Sunrise, Sunset, and Tithi times.

3

Janam Kundli & Matchmaking

Seekers generate their birth chart at `/kundli` or perform matchmaking at `/kundli-matching`. Added an 'Already Married' option which automatically strips future marriage windows, replacing them with a custom compatibility card.

4

Booking & Live Consultations

Seekers browse verified experts, recharge their wallet using Razorpay integration at `/user/transactions`, and request a live session at `/consult/[id]`.

Seeker Matchmaking Panel & Interface View:

3. Astrologer Onboarding & Expert Workspace

Astrologers represent the professional service providers. They complete onboarding, manage availability, review earnings, and connect with users inside specialized dashboards.

1

Signup & Professional Onboarding

Astrologers register at `/astrologer/signup` and complete a detailed resume at `/astrologer/onboarding` (submitting Govt ID, certificates, bio, languages, experience, and pricing per minute).

2

Robust Upload Fallbacks (Base64)

If Firebase Storage is deactivated, the app triggers a Base64 converter fallback. Uploaded avatars and PDF documents are saved directly inside Firestore as Data URI strings, ensuring onboarding succeeds.

3

Royal Purple Dashboard

Restyled the dashboard (`/astrologer/dashboard`) using Indigo & Royal Purple highlights. This instantly differentiates the expert console from the seeker's warm gold panel, displaying pending queues and metrics.

4

Consultation & Payout Transactions

Experts receive calls, review transcripts, and check total earnings in `/astrologer/transactions`, requesting wallet payouts directly.

Astrologer Profile Preview & Verification Card:

4. Admin Monitoring Console & Approvals Portal

The Admin (Company Owner) has superuser permissions. Only 'enjoylifeauw@gmail.com' is assigned this role. The Admin reviews applicants, tracks business metrics, and manages verification updates.

* Real-Time Firestore Business Metrics

The admin dashboard at `/admin`` aggregates total platform revenue by summing recharge transactions (``completed`` status) in real time. It counts active experts and shows total booking volumes.

* Approvals & Verifications Panel

Located at `/admin/verify-astrologers``. When a new astrologer signs up, their profile details are listed. The admin inspects the government ID, experience parameters, and certificate links before approving.

* Security Bypass Controls

The admin bypasses standard onboarding limits. This enables the owner to review both Seeker and Astrologer dashboards to check layouts, availability controls, and consult pages without restriction.

* One-Click Quick Actions (Email Alerts)

When an astrologer applies, an email alert containing profile data is dispatched. The email contains two quick links pointing to `/api/admin/verify-astrologer-direct?action=approve/reject``. The API route automatically routes to the client verification screen to process the request securely.

ADMIN ROLE ASSIGNMENT NOTICE:

Role assignments are controlled in `AuthContext.tsx`. Admin email overrides ignore raw Firestore records to prevent privilege escalations

5. Live Consultation Room & Chat Mechanics

Consultations happen inside a real-time web workspace at `/consult/[id]`. This panel manages chat messages, transcript exports, and peer-to-peer connection statuses.

UID-Based Chat Bubble Alignment:

To support multiple device logins and administrator testing, chat message ownership is verified using Firestore UUIDs (`senderId` matches the logged-in viewer's UUID). Outgoing messages slide to the right (colored white), while incoming messages align to the left (colored light green).

WhatsApp-Inspired UI:

Designed a clean WhatsApp-themed interface with separate avatar displays, name indicators, and timestamp tags, ensuring high readability.

Dynamic Participant Identifiers:

Names (e.g. 'Seeker Name' or 'Astrologer Name') are fetched dynamically on mount from the consultation record. Fallback labels prevent 'You' vs name duplication, maintaining a cohesive view.

Live Consultation Chat Room Workspace Interface:

6. Technical Architecture & DB Collections

AstroPandit Connect is built with Next.js (app router) for the frontend, styled with Vanilla CSS and TailwindCSS, and leverages Firebase Cloud Suite for backend services.

Firestore Database Schema Mapping:

USERS

Fields: uid (ID), email, displayName, role (seeker/astrologer/admin), createdAt, profileComplete

ASTROLOGERS

Fields: uid (ID), name, email, experience, specializations, ratePerMinute, verified, govIdNumber

BOOKINGS

Fields: id (ID), seekerId, astrologerId, status (scheduled/completed), startTime, duration

TRANSACTIONS

Fields: id (ID), userId, amount, type (recharge/payout), status (pending/completed), gatewayOrderId

TRANSCRIPTS

Fields: consultationId (ID), messages [{ senderId, senderName, text, timestamp }], status

Key Infrastructure Services:

- Firebase Auth: User registration, Google OAuth, and secure session management.
- Firebase Firestore: Real-time data sync for chat transcripts, reviews, and bookings.
- Razorpay SDK: Secure payment gateway integration for user wallet recharges.
- SMTP / NodeMailer Client: Gmail SMTP transactional email alerts for new registrations.

7. Security Protocols & Leak Mitigations

* No Hardcoded Credentials

The exposed GCP API Key was eliminated from source files. The app dynamically queries credentials from `process.env` (Vercel settings) in production and parses `.env.local` locally, preventing keys from leaking into the public Git repository history.

* Safe Dynamic Path Traversals

Removed the unused `deep_search.js` file. Restricting path inclusions prevents potential directory traversal attacks and ensures that the server filesystem is inaccessible to external inputs.

* DOM XSS Input Sanitization

Removed `innerHTML` in public tools (like `camera-test.html`). Replaced them with `textContent` and `createElement` DOM injections to guarantee all browser data is treated strictly as plain text, resolving DOM clobbering vulnerabilities.

* Transitive Dependency Auditing

Declared strict npm overrides for `protobufjs`, `lodash`, `axios`, `serialize-javascript`, `fast-uri`, `rollup`, `next-intl`, `brace-expansion`, and `fast-xml-parser`, closing all CVE entry points flagged by static SCA scanning.

Conclusion & Future Scope

AstroPandit Connect is now fully secured against all vulnerabilities flagged by SCA reports and SAST engines, and conforms to industry standards. Future development blocks include setting up custom verified email domains for nodemailer and configuring Firebase Storage rules to restrict access to authenticated users.
